FIGURE LOGIC

How to Solve Figure Logic

Figure Logic is a crossword-type puzzle in which the answers are numbers instead of letters. It is solved by completing some simple arithmetic problems, which will enable you to move from clue to clue.

You will not always be able to complete an entire number at first, but you may, by logic, be able to determine what one or more of the digits will be. If you enter the digits you know into the diagram, they may help you to solve other clues. This will enable you to return to the unfinished numbers and complete them. Starting helps are located on the bottom of the solution pages.

RULES AND DEFINITIONS

- 1) No answer ever begins with a zero.
- 2) The square of a number is that number multiplied by itself; the square root of a number is a number that, when squared, results in the given number. The square of 6 is 36; the square root of 36 is 6 (6 x 6 = 36).
- 3) The cube of a number is that number multiplied by itself multiplied by itself. The cube of 6 is 216 (6 x 6 x 6 = 216).
- 4) When solving diagramless Figure Logics, remember that the diagrams have top-left to bottom-right symmetry, so when you determine the location of one black square, you can also enter its counterpart.
- 5) Cryptic Figure Logics have clues that contain a capital letter that stands for a digit 1 to 8. When the grid is completed, the letters written in corresponding numerical order will spell out a word or phrase.

Note on 16-Across, 4-Down, 12-Down, and 17-Down: No digit is 0 or 1; all four digits are different; the number formed by the first two digits is divisible by 2, by the first three digits is divisible by 3; the whole number is divisible by 4. Each begins with a different digit. The four numbers are as small as possible subject to the above conditions.

The three numbers marked X between them contain all ten digits, as do the three numbers marked Y. The sum of the digits is the same in all six. Each number in the X set is the largest possible arrangement of its digits; each number in the Y set is the smallest possible arrangement of its digits (no number begins with zero). For the 3-digit numbers in X or Y, no pair of digits appears twice.

Five philanthropists recently donated adjacent building lots to Habitat for Humanity on which volunteers would build low-cost houses. All of the lots were the same depth, but the width of the lots differed by at least five feet. The smallest lot was more than fifty feet wide, and the largest was less than one hundred feet. NOTE: All dimensions are expressed in feet unless specified otherwise. A lot's depth in feet times its width in feet equals its square footage; square footage divided by nine equals square yardage.

ACROSS

Brian, Liz, and Joy were comparing the costs of each one's tuition, room and board, books, student fees, and car expenses for the fall semester at college. Joy moaned that her tuition at the University was three times Liz's tuition at State College, but Liz noted that her tuition was three times the tuition charged at the community college Brian attends. Joy doesn't have a car, since she lives on campus, but her room and board costs as much as Brian's apartment and food plus the cost of Liz's books. Liz was happy to live rentfree with her parents, paying for her food only; she ended up spending twice as much on her new car as she spent for room and board. Brian, on the other hand, was able to keep his beloved old car running for only three times the cost of Liz's student fees. The strangest thing they discovered was that each student spent eight dollars for books for every year he or she had lived.

When Lady Elaine applied for the position of chatelaine at Logicians' Castle, she was tested on her math and logic skills with this Figure Logic. If solved correctly, she was told, the solution would provide her with all the information required to do her job correctly, including the number of yeomen, serfs, and scullions needed the total number of inhabitants, and the measurements of the castle itself. Elaine quickly solved the puzzle, and was hired immediately. Can you do as well?

Note: This plan of the Castle is not drawn to scale.

The small adjacent kingdoms of Quafor and Bicsten have similar monetary systems. Each has only six coins in circulation and no paper money. In Quafor, the smallest-value coin and basic unit of currency is the Qua; its other coins, in increasing value, are the San, Dec, Fer, Olp, and Diln. Each of these is worth some whole number of Quas, but each coin is marked only with its name, not its value in Quas. In Bicsten, the basic unit is the Bic, but there is no one Bic coin. The coins they do have, in increasing value, are the Caj, Jek, Luc, Gov, Kay, and Nept; as in Quafor, these coins are marked only with their names. One Diln equals one Nept in value, and these are the only two coins worth more than 100 Quas/Bics; neither, however, is worth more than 200. Two Quas equals three Bics in value, but no coins other than the Diln and Nept reflect that value ratio. To provide additional currency values, each country packages sealed rolls of all their coins except the Qua; each roll is worth the total Qua/Bic value of the coins in it. The number of coins in a roll is different for each coin. Use this information and the clues below to complete the diagram.
